Motivation of Traffic Generation Problem

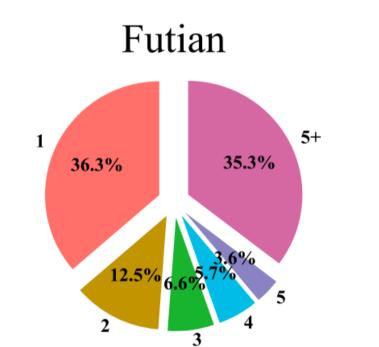

Conventional traffic prediction models are *contingent* upon an expansive reservoir of historical traffic data to enhance their predictive performance. However, the acquisition of real-world traffic data, particularly in smaller cities, is a big challenge.

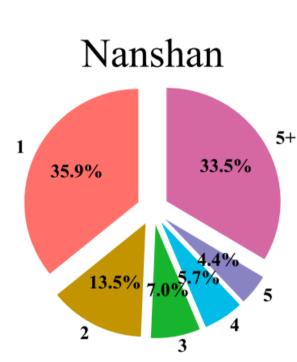

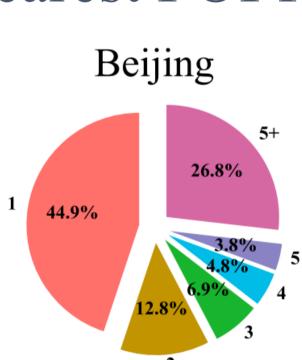

Common frameworks of Traffic Prediction and Traffic Generation problems

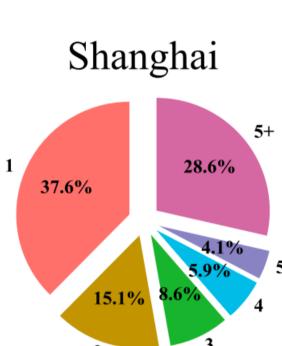

Challenges

Real-world road network graphs often *deviate from* the elemental principle that "*neighbor nodes exhibit similar features*". Hop number of the shortest path between node pairs with nearest POI feature:

Most previous models suffer from the perceived inadequacy of end-to-end loss.

Experiment Results

TG-SCR achieves the *best performance* on four real-world dataset.

Pipeline of Our Proposed Model: TG-SCR

- ➤ Graph Reconstruction Module. This module includes a *k-NN Graph Builder* and a *k-NN Graph Aggregator* to reform the original roadnet graph and eliminate biases.
- ➤ POI Contrastive Module. This module adds a supervised contrastive loss to help TG-SCR explicitly hold the former similarity relationships.

> Training algorithm of TG-SCR:

Algorithm 1 Training procedure of TG-SCR

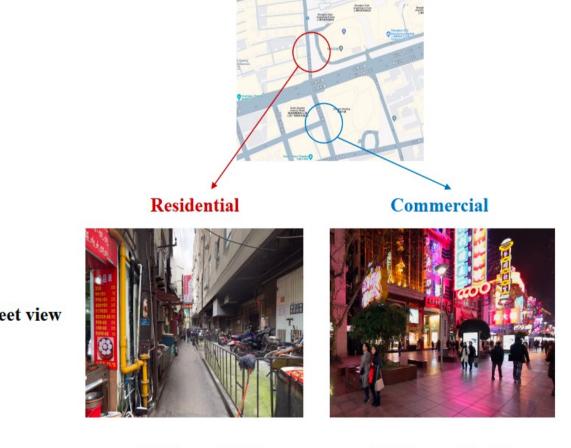

Input: Roadnet graph G with map-matched POI feature X, encoder $e(\cdot)$ and decoder $d(\cdot)$ parameterized with θ

- 1: Build k-NN graph G' from G based on Eq (3)
- 2: Get Aggregated POI feature X' from X based on Eq (4)
- 3: Compute POI embeddings: E' = e(X')
- 4: repeat
- Sample a training batch B including N nodes
- Define positive set \mathbb{P} and negative set \mathbb{N} based on Eq (5) and Eq (6)
- 7: Compute L_{Total} based on Eq (9)
- 8: Back Propagation
- 9: Update θ based on Eq (7)
- 10: until $L_{Total} < \epsilon$

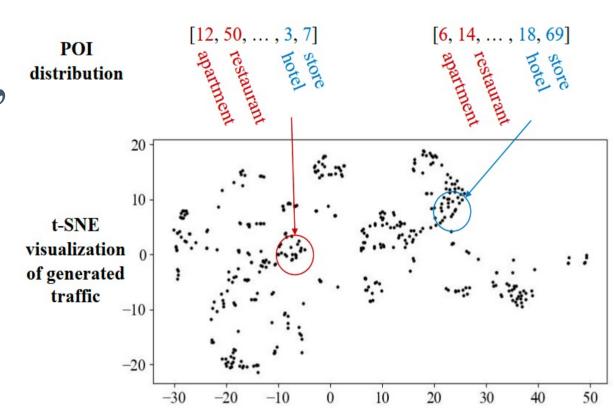

Output: Predicted traffic \hat{Y}

Real-World Case in Shanghai

Despite close in graph, the generated traffic flows of nodes in these two locations have a significant difference.

Through t-SNE visualization, distribution
TG-SCR keenly captures the
POI distribution relationship. t-SNE visualization
